## Introduction

GD Star Rating is WordPress plugin that can be used to add rating capabilities to posts, pages and comments on your blog. But, there is a lot more to this plugin compared to any other similar plugin.

## Requirements

Plugin is developed and tested only for WordPress 2.5.0 or newer. There is no plan to add support for older versions. Current WordPress 2.6 is also supported, but some of the features could be a problem. As long as you don't change location of your wp-content folder, things will work just fine. If you move this folder, then tinyMCE3 editor button will not work, and you must created shortcode manually.

## Features

The following list contains full list of features:

1. Rating of posts and pages
2. Rating of comments
3. Review Rating
4. AJAX voting
5. Voting rules on post/page base
6. Moderation of votes on post/page base
7. Different star styles and sizes
8. Separate saving of voting data for registered users and regular visitors
9. Logging of each vote
10. Saving cookies with votes
11. Calculation of voting trend data for each post, page and comment
12. Rating multi instance support widget
13. WordPress shortcode support
14. WordPress editor button and tinyMCE3 plugin for shortcode
15. Multi language support
16. Setting number of stars for voting (up to 20)
17. Control Panel
18. Manual placement functions of the rating code
19. Category support for posts
20. User Guide

## Planned Features

Beside the implemented (or in work) features, there are still some things that will be added later:

1. More options for shortcode
2. More options for widget
3. Widget for comments votes
4. New methods of rating

## Included Graphics

### Stars Styles

Each stars style comes in different sizes.

#### Supported stars sizes:

Currently 4 sizes are supported:

- **Mini:** 12px
- **Small:** 20px
- **Medium:** 30px
- **Big:** 46px

### Included stars styles

Stars can be in PNG, JPG or GIF format. PNG can be with full transparency (32bit PNG). GIF supports only 1 bit for transparency, just like 8bit PNG.

- **0:** Oxygen (32bit PNG)
- **1:** Crystal (32bit PNG)
- **2:** Quiet (32bit PNG)
- **3:** Shiny (32bit PNG)
- **4:** Aero (32bit PNG)
- **5:** Inspire (32bit PNG)
- **6:** Nuvola (32bit PNG)
- **7:** Starscape (32bit PNG)
- **8:** Starscape on White (8bit GIF)
- **9:** Milky (32bit PNG)
- **10:** Ruby (32bit PNG)
- **11:** Fatty (32bit PNG)
- **12:** Aeon (32bit PNG)
- **13:** Soft (32bit PNG)

### Trend Icons

Trend icons are used to represent post rating and voting trends. Each set has three icons for rise, fall and no change. Trend icons have no preset sizes, but included will be 16x16 px.

#### Included icons

Icons types are the same as for the stars.

- **0:** Fam Fam Fam (32bit PNG)

## Rating Types

Currently plugin supports 3 types of ratings, and 3 more will be implement in the future.

### Implemented:

1. **Article Rating (Posts and Pages):** This is the main type of rating. It's used on posts and pages (articles from now on). One article can have one rating. Rating is recorded for users (registered blog users logged in) and visitors (not logged in).
2. **Article Review Rating:** Review rating is no-votes rating. Rating is set only through admin panel (plugins control pages) or on edit screen for each post or page (sidebar control). This value represents rating added by the article author or editor.
3. **Comments Rating:** This is the rating for comments. Each comment can have rating block active. Rules for comments are not per comment but per post. So, all comments for one post have the same rules.

### To be implemented:

1. Multiple Rating (v1.2.0)
2. Recommend Article Rating (v1.1.0)
3. Recommend Comments Rating (v1.1.0)

## Using the plugin

I will try to explain in details how the plugin works and how you can use it and set it to fit your needs.

### Intro

When you first install plugin it should work right away and it should display stars for all posts/pages and comments. Rating displayed with both comments and posts/pages basically looks the same, but it can be set differently, so the rating for comments and articles can have different number of stars, different styles, text and anything else.

### Rating block

The rating block you see is called exactly like that **RATING BLOCK**. Here is the example of how this block looks like:

#### *Rating Header:*

In the above picture, rating header is a text: “Please, rate this post:”. This is the text, always rendered above the stars. You can add custom CSS class to this element, and you can change its position, color and other properties. Rating text supports html markup.

#### *Stars:*

This is the main part of the rating block and contains the actual stars. All visitors will see current rating displayed by the block, and if the visitor/user can vote, then when hovers over the stars, a new (usually red) stars will appear as a selected rating. When visitor/user clicks on the desired rating value, vote is recorded by the plugin.

#### *Rating Text:*

Third part of the block is a description of current rating, and this text supports templates to format it. Also, this text can be rendered left, right, top or bottom to the stars. How the templates work, we will see later. Rating text, like header supports adding custom CSS class.

## Rendering of rating block

For rating block to appear, plugin must know where to render it. There are three types of rendering stars:

### *Automatic rendering*

This rendering is controlled by the plugin, and is more or less the same for articles and comments. With this, block is always rendered at the end of the article or comment.

For article, plugin can insert rating code in individual posts or pages, for posts in the archives and on the front page. This is controlled on the settings page in the admin control panel. By default all 4 options are

checked and active. For comments this is much simpler, and either rating is rendered automatically or is not.

For comments, rating block can be inserted only at the end of the comment. This is controlled by the setting in the control panel comments tab.

### *Shortcode rendering*

If you don't like where the rating block is placed automatically by the plugin, you can turn off these options and you can add shortcode in your posts, and with that you can determine the place where plugin places the block. Shortcodes for this are **[STARRATER]** or **[STARRATINGBLOCK]**.

Shortcode rendering can't be used for comments.

### *Function in theme template file rendering*

This last method is here for the theme designers or advanced user and this method requires changes to the theme files and calling the function that will render the block. It's very important that this call must be made from inside the post/page loop. Function name for this: **wp\_gdsr\_render\_article()**.

For comments function name is: **wp\_gdsr\_render\_comment()**.

If you don't use any of this, then the rating block and stars will not be rendered. You can even have multiple rating blocks in the same article, but they will act the same, so there is no point in that.

## Widgets

Currently there is only one widget that can be used to display rating data.

### GD Star Rating Widget

This widget can be used to display top rated posts and pages. But there is a lot more to this widget, large number of options you can set. Widget supports multiple instances, so you can have more than one in sidebars with different settings. Also, widget supports template output, and you can set it to look any way you want using lists, tables or anything else.

Settings for a widget are divided into several collapsible groups.

#### Main Options

Main options include title for the widget, display and grouping. Display can be used to show widget to only visitors or only to logged users. Grouping option is interesting feature allowing you to display ratings on user or category basis.

If you choose user grouping, widget will display users rather than posts, and rating will be average rating for all posts from that user. This way you can rank post authors by the rating of their articles. If you choose category grouping, widget will display categories, and average rating for all posts in that category.

#### Trend

This group contains options for setting the render style for the trend. Plugin can calculate voting and rating trends, and they can be displayed using text or using images. You can select here what you prefer. If you select text, you can set each trend element, and if you select image you can select image set you want to use.

#### Filter

Filter options include various filter that can help you narrow down post you want to show using categories, dates and other criteria, and also by setting sorting options.

**GD Star Rating** Cancel

Title:

Show Widget To:

Items Grouping:

**Trend**

Rating trend display as:

**Elements**

Click on the header title to display the options.

Change Remove

### Shortcodes

Current version has only one shortcode implemented. Bellow you can see shortcode details and all options for the shortcode explained.

#### Shortcode: **STARREVIEW**

This shortcode is used to render post review rating stars. This shortcode has no attributes.

#### Shortcode: **STARRATER / STARRATINGBLOCK**

This shortcode is used to render rating stars for the post or page in custom location. This shortcode has no attributes.

#### Shortcode: **STARRATING**

This shortcode is used to render table with voting summary for post and/or pages. It has a lot of attributes that can be used to make table look exactly the way you want it.

### Using manual functions

Automatic rendering is controlled by plugin. But in many cases you might need to do things 'your own way'. For this I have created few functions, and more will come.

#### Render Article: `wp_gdsr_render_article()`

This method will display rendering stars for post or page. This must be used in a post loop or will not work. This is the same as using STARRATER shortcode.

#### Render Article: `wp_gdsr_render_comment()`

This method will display rendering stars for comment. This must be used in a comment loop or will not work. This is the same as using STARRATERCOMMENT shortcode.

#### Render Review Rating: `wp_gdsr_render_review()`

This method will render stars for post review rating. This is the same as using STARREVIEW shortcode.

#### Render Widget: `wp_gdsr_render_widget($widget)`

This method will render widget like content. This method requires a number of parameters. If no parameters are passed, then the default widget parameters will be used. Parameters are in the form of array.

For rendering items you can specify exact template you want to use for header of the widget, each item and footer. Template strings can be HTML encoded or not. For this use, I recommend decoded HTML strings. Template can contain specific strings that will be replaced with actual values (hence the template). List of all supported template strings can be found in the next chapter.

## Plugin Settings

All the settings are divided into several tabs.

### General

First tab contains administration pages settings, plugin features and stars preview.

The screenshot shows the 'General' tab of the GD Star Rating plugin settings. It is divided into three sections: Administration Settings, Plugin Features, and Stars Preview.

- Administration Settings:** Includes 'Maximum screen width' set to '1680 px' and 'Rows for display' set to '5'. There is a checked checkbox for 'Display Advanced Settings'.
- Plugin Features:** Includes checked checkboxes for 'Moderation options and handling', 'Review Rating', and 'Comments Rating'. There is an unchecked checkbox for 'Use IE6 PNG Transparency Fix'.
- Stars Preview:** Includes dropdowns for 'Stars' (set to 'Oxygen') and 'Size' (set to 'Medium (30px)'). To the right is a visual preview of star ratings on various backgrounds (black, red, green, white, blue, yellow, grey, and a patterned background).

### Administration Settings

With this set of options you can control maximum screen width that will affect all the grids rendered by plugin and make them easier to read if you use large monitor resolutions. Also, you can set number of rows displayed on one page for grids.

Advanced settings are settings not too important for most users, so if you want them too, check this option.

### Plugin Features

If you don't need all the plugin features, you can disable the one you don't use.

IE6 PNG Transparency Fix will only be used on MS Internet Explorer 6 browsers and no matter if it's on or off will not affect any other browser.

### Stars Preview

Here you can see how the different stars will look on different backgrounds. This can help you decide what combination of stars and their size will be best for your blog.

### Articles Rating (Posts and Pages)

Options here are divided into two groups, one for rating and the other for review.

The screenshot shows the configuration interface for GD Star Rating, divided into two tabs: 'Articles (Posts And Pages)' and 'Comments'. The 'Rating' section for 'Articles' includes settings for 'Stars' (Oxygen, Medium [40px], 10), 'Rating Alignment' (No alignment), 'Rating Text Placement' (Bottom), 'Rating Header' (Display header text), 'Rating Block CSS Class' (empty), 'Default Vote Rule' (Everyone can vote), 'Default Moderation Rule' (No moderation), and checkboxes for 'Auto Insert Rating Code' (checked for individual posts, pages, archives, and front pages) and 'Save cookies to prevent duplicate voting' (checked). The 'Review' section for 'Comments' includes settings for 'Stars' (Oxygen, Small [20px], 8), 'Rating Alignment' (No alignment), 'Rating Header' (Display header text), 'Rating Block CSS Class' (dasdfdsf), and 'Text to display' (empty).

First row contains options for setting the look of stars used for rating and their number (up to 20).

In the second row you control placement of rating text. To better understand the rendering, here is the image with complete rating block.

### Rating Block

Rating block has 3 parts. First is the Header, always rendered at the top of the rating block. Bellow the header, you can see the rating stars and on bottom is rating text. Rating text can be rendered all around the rating stars, and it can be placed on top, bottom, left or right of the stars. It can also be hidden, or hidden if no votes are recorded for that post. Rating block can be aligned. Rating header text can contain full HTML code for formatting the text.

Also, complete rating block and rating header can have custom CSS class added to change the way they look. These CSS options are advanced settings and they are hidden if you don't activate advanced settings option on general tab.

### Default Settings

Default settings for voting and moderation rules are automatically added to each new post or page. More details about the rules will be in the next chapter.

### Rating block inserting

For articles, rating code can be inserted automatically. With 4 checkboxes you control where the rating block will be automatically inserted into the posts or pages.

## Other options

There are few more options you can set. You can use cookies to record votes and help to prevent multiple voting, and you can also prevent recording votes from author of the post or page. This way authors can rate their own posts.

## Review Rating

Posts and pages support special type of rating, called review rating. Settings are pretty much the same as for the regular rating. Rating block for review rating can't be inserted automatically in the post, and you need to use shortcode to add rating code to the post.

## Comments Rating

The screenshot shows the 'Comments' tab of the GD Star Rating settings. The 'Rating' section is active, showing various configuration options. The 'Stars' dropdown is set to 'Oxygen', 'Mini' is selected for the icon, and 'Number Of Stars' is set to '8'. 'Rating Alignment' is 'No alignment', 'Rating Text Placement' is 'Bottom', and 'Display Header Text' is unchecked. 'Rating Block CSS Class' and 'Rating Text CSS Class' are empty. 'Default Note Rule' is 'Everyone can vote' and 'Default Moderation Rule' is 'No moderation'. 'Auto Insert Rating Code' is checked for 'for comments'. At the bottom, two checkboxes are checked: 'Save cookies to prevent duplicate voting' and 'Prevent a comment author to vote. This is only for registered users.'

General   Articles (Posts And Pages) <b>Comments</b>			
<b>Rating</b>	Stars: Oxygen	Mini [12px]	Number Of Stars: 8
Rating Alignment	No alignment	Rating Text Placement	Bottom
Rating Header	<input type="checkbox"/> Display header text	Text to display	
Rating Block CSS Class		Rating Text CSS Class	
Default Note Rule	Everyone can vote	Default Moderation Rule	No moderation
Auto Insert Rating Code	<input checked="" type="checkbox"/> for comments.		
<input checked="" type="checkbox"/> Save cookies to prevent duplicate voting.			
<input checked="" type="checkbox"/> Prevent a comment author to vote. This is only for registered users.			

Basically, comments settings are very much the same as the settings for articles.

### Voting and moderation rules
